

Final Drive

Summarize for us the overall condition of the final drive before you started working on it. Was it intact?

Describe in as much detail as possible, what was involved in the restoration of your tractor's final drive. Support your words with pictures. Tell us, in detail, what we will see in the before and after photos. Anything of interest you would like us to pay particular attention to?

Final Drive

The final drive consists of the bull gears, ring gear, and the two rear axles. When I was working in the transmission I had taken out the bull gears, cleaned them, and turned them around so it could run on a new wear surface. Once back in, I had to check the backlash on the ring gear with a dial indicator.

After cleaning out the rear axles I had to replace the seals in them. To do this and have the housing seal properly, the housing was held slightly off the rear end. Then I installed seals in the end of the axle housing. After sand blasting was complete I filled the housing with gear oil.
